

Profibus PA interface for use with Bluetooth

VCI10-BP is a Profibus PA communication interface for use with Bluetooth® connectivity. It allows connection to Profibus PA networks making commissioning, operation, maintenance and calibration processes easier, as well as diagnostics and data acquisition of any Profibus-PA device.

It can operate connected into the Profibus PA bus or in stand-alone mode. When in stand-alone mode it can power the device directly and there is no need for coupler DP/PA to establish the communication. This feature is very useful in bench work or in initial configuration when the Profibus PA network is not yet established. A rechargeable long-life battery powers the VCI10-BP.

In Android® devices VCI10-BP works with the VMT-Profibus application (Vivace Mobile Tool) and in Windows® devices works with tools based on FDT / DTM and EDDL.

Vivace also has the model for USB connectivity: VCI10-UP.
